this book is mainly intended for first year university students who undertake a basic abstract algebra course as well as instructors it contains the basic notions of abstract algebra through solved exercises as well as a true or false section in each chapter each chapter also contains an essential background section which makes the book easier to use

this book the second of two volumes contains approximately 350 exercises in algebra which have featured exam questions for the algebraic structure and algebra i courses taught by the authors at the university of pisa each exercise is presented together with one or more solutions carefully written with consistent language and notation a distinguishing feature of this book is the fact that each exercise is unique and requires some creative thinking to be solved the themes covered in this volume are group theory and sylow theorems commutative rings with an emphasis on unique factorisation gaussian integers field extensions and galois theory the book includes a detailed section recalling relevant theory that can be used as a reference for study and revision a list of preliminary exercises introduces the main techniques to be applied in solving the proposed exam questions this

volume is aimed at second year students in mathematics and computer science

the book is intended to serve as an introductory course in group theory geared towards second year university students it aims to provide them with the background needed to pursue more advanced courses in algebra and to provide a rich source of examples and exercises studying group theory began in the late eighteenth century and is still gaining importance due to its applications in physics chemistry geometry and many fields in mathematics the text is broadly divided into three parts the first part establishes the prerequisite knowledge required to study group theory this includes topics in set theory geometry and number theory each of the chapters ends with solved and unsolved exercises relating to the topic by doing this the authors hope to fill the gaps between all the branches in mathematics that are linked to group theory the second part is the core of the book which discusses topics on semigroups groups symmetric groups subgroups homomorphisms isomorphism and abelian groups the last part of the book introduces sage a mathematical software that is used to solve group theory problems here most of the important commands in sage are explained and many examples and exercises are provided

probabilistic group theory combinatorics and computing is based on lecture courses held at the fifth de brún workshop in galway ireland in april 2011 each course discusses computational and algorithmic aspects that have recently emerged at the interface of group theory and combinatorics with a strong focus on probabilistic methods and results the courses served as a forum for devising new strategic approaches and for discussing the main open problems to be solved in the further development of each area the book represents a valuable resource for advanced lecture courses researchers at all levels are introduced to the main methods and the state of the art leading up to the very latest developments one primary aim of the book s approach and design is to enable postgraduate students to make immediate use of the material presented
